AMENDMENTS TO THE CLAIMS:

1. (Currently Amended) Suture material for surgery comprising one or more filaments and formed with a coating, wherein the coating at least partly comprises a waxy bioresorbable polymer, which is essentially formed from a random terpolymer with a completely amorphous structure, the terpolymer is formed using glycolide, ε-caprolactone and trimethylene carbonate, and the terpolymer contains glycolide in a proportion of 5 to 50 wt. %, ε-caprolactone in a proportion of 5 to 95 wt. % and trimethylene carbonate in a proportion of 5 to 95 wt. %.
2. (Canceled)
3. (Canceled)
4. (Original) Suture material according to claim 1, wherein the terpolymer contains trimethylene carbonate and ε-caprolactone in a weight ratio between 95:5 and 5:95.

5. (Original) Suture material according to claim 1, wherein the terpolymer is produced by random copolymerization of glycolide, ϵ -caprolactone and trimethylene carbonate.
6. (Original) Suture material according to claim 1, wherein the terpolymer has an average molecular weight in the range of more than 30,000 Dalton.
7. (Original) Suture material according to claim 1, wherein the terpolymer has a glass transition point in the range -40 to +20°C.
- ✓ 8. (Original) Suture material according to claim 1, wherein the coating material has an inherent viscosity of 0.4 to 3.0 dl/g, particularly 0.7 to 1.3 dl/g, measured in HFIP at 25°C and a concentration of 0.5 wt.%.
- ✓ 9. (Original) Suture material according to claim 1, wherein the coating material contains at least one plasticizer in a proportion of 1 to 30 wt.%.

10. (Original) Suture material according to claim 1, wherein the

coating is formed from a combination of the bioresorbable polymer with fatty acid salts.

11. (Original) Suture material according to claim 1, wherein the coating represents 0.2 to 50 wt.% of the total weight of the coated suture material.
12. (Original) Coating material for surgical suture material for surgery essentially formed from a bioresorbable polymer, which is essentially formed from a random terpolymer with a completely amorphous structure.
13. (Original) Coating material according to claim 12, wherein the terpolymer can be applied in the fluid state without solvent in a melted state to the suture material.
14. (Original) Coating material according to claim 12, wherein it is formed from a combination of the bioresorbable polymer with fatty acid salts.
15. (Original) Coating material according to claim 13, wherein it is formed from a combination of the bioresorbable polymer with fatty acid salts.

16. (Original) Process for the production of a suture material for surgery comprising one or more filaments with a coating, wherein that coating takes place by the application of a bioresorbable polymer, which is essentially formed from a random terpolymer with a completely amorphous structure.
17. (Original) Process according to claim 16, wherein for coating the suture material a solution of the terpolymer is applied, where the terpolymer is dissolved in an organic solvent selected from the group of non-toxic organic solvents.
18. (Original) Process according to claim 17, wherein the terpolymer for a coating solution is dissolved in a concentration of 0.1 to 10, more particularly 0.5 to 5 wt.%.
19. (Original) Process according to claim 17, wherein for coating purposes, the suture material is drawn through a solution of the terpolymer.
20. (Original) Process according to claim 17, wherein for coating purposes the suture material is sprayed with a

solution of the terpolymer.

21. (Original) Process according to claim 17, wherein for coating purposes a solution of the terpolymer is applied to the suture material using a softening stick.
22. (Original) Process according to claim 17, wherein coating is performed at a temperature up to 40°C.
23. (Original) Process according to claim 17, wherein following the application of the coating, the suture material is dried with a heating device at 80 to 160°C.
24. (Original) Process according to claim 16, wherein coating with the terpolymer takes place in a melted state.
25. (Original) Process according to claim 16, wherein coating takes place with a bioresorbable polymer combined with fatty acid salts.

L22 ANSWER 1 OF 20 HCAPLUS COPYRIGHT 2004 ACS on STN
2004:119779 Document No. 140:152055 Process for making **sutures**
having improved knot tensile strength. Pokropinski, Henry; Scalzo,
Howard; Fischer, Jerome A. (Ethicon, Inc., USA). U.S. Pat. Appl.
Publ. US 2004028805 A1 20040212, 10 pp. (English). CODEN: USXXCO.
APPLICATION: US 2002-209202 20020731.

AB A process for improving the knot tensile strength of a braided
suture while maintaining its first throw holding
characteristics includes the steps of applying a biocompatible
copolymer to the braided **suture** and then heating the
suture to a temp. above the flow point of the copolymer. An
outer coat is applied to the **suture** after the heating
step. The **suture** may be scoured with a solvent before the
co-polymer is applied or the copolymer may be applied simultaneously
with the scouring step. The copolymer preferably comprises 1 or
more lactones, more preferably, ϵ -caprolactone and
glycolide. This process may be used with bioabsorbable
sutures, such as those comprising filaments made of
polyglycolide and polylactide. A series of tests were performed to
examine the knot tensile strengths of Vicryl braided **sutures**
coated with a mixt. of 90% ϵ -caprolactone and 10% glycolide
(90/10 CAP/GLY) in EtOAc. Coatings were applied by using
conventional lab. equipment. The application of 90/10 CAP/GLY to
the **suture** produced at least some increase in knot tensile
strength over that measured for the corresponding control
suture. Thus, a co-polymer coating may be applied to a
suture simultaneously with removing the spin finish.

L22 ANSWER 2 OF 20 HCAPLUS COPYRIGHT 2004 ACS on STN

2003:492741 Document No. 139:69689 Amorphous polymeric polyaxial initiators and compliant crystalline copolymers therefrom. Shalaby, Shalaby W.; Mathisen, Torbjorn (USA). U.S. Pat. Appl. Publ. US 2003120029 A1 20030626, 12 pp., Cont.-in-part of U.S. Ser. No. 3,640. (English). CODEN: USXXCO. APPLICATION: US 2002-285040 20021031. PRIORITY: US 2000-698527 20001027; US 2001-3640 20011102.

AB An absorbable cryst., monocentric polyaxial copolymer comprising a central carbon or nitrogen atom and at least three axes, each of which includes an amorphous flexible component adjacent and originating from the central atom and a rigid, crystallizable component extending outwardly from the amorphous, flexible component is disclosed along with the use of such copolymer in medical devices which may contain a bioactive agent. The present invention also relates to a **suture**, stents, stent mantles and sealing devices made from the polyaxial copolymer. Thus, triaxial polymeric initiator was prepd. by reacting glycolide 22.74, caprolactone

117.31, trimethylene carbonate 149.94 g with triethanolamine 1.34 g in the presence of stannous octoate toluene soln. Then, L-lactide 282.24 and caprolactone 27.98 g were added to the initiator to give a cryst. segmented copolymer with Tm 148-' and inherent viscosity in chloroform of 1.14 dL/g.

L22 ANSWER 3 OF 20 HCAPLUS COPYRIGHT 2004 ACS on STN

2002:833543 Document No. 137:338420 Amorphous polymeric polyaxial initiators and compliant crystalline copolymers made from them and their use in medical devices. Shalaby, Shalaby W.; Akerfeldt, Dan; Preinisz, Fredrik; Egnelov, Per; Mathisen, Torbjorn (USA). U.S. Pat. Appl. Publ. US 2002161168 A1 20021031, 15 pp., Cont.-in-part of U. S. Ser. No. 698,527. (English). CODEN: USXXCO. APPLICATION: US 2001-3640 20011102. PRIORITY: US 2000-698527 20001027.

AB An absorbable cryst., monocentric polyaxial copolymer comprising a central carbon or nitrogen atom and at least three axes, each of which includes an amorphous flexible component adjacent and originating from the central atom and a rigid, crystallizable component extending outwardly from the amorphous, flexible component is disclosed along with the use of such copolymer in medical devices which may contain a bioactive agent. The present invention also relates to a **suture**, stents, stent mantles and sealing devices made from the polyaxial copolymer. Thus, heating a mixt. of caprolactone 142.4, trimethylene carbonate 159.4, trimethylolpropane 1.666 g and 1.0 mL of a 0.203 M soln. of stannous octoate catalyst in toluene to 50° under vacuum until complete melting of the contents for 30 min, purging the system with Ar, stirring at 32 rpm, heating to 150° and maintaining at 150° for 4 h gave a polyaxial polymeric initiator (PPI). Cooling the reaction mixt. above to 110°, adding 398.5 g glycolide, mixing until complete melting the glycolide, heating to 180° with stirring, maintaining at this temp. for 2 h, cooling to 50° and maintaining the heat overnight gave a product which was isolated, ground, dried, extruded and redried to give an extrudate with inherent viscosity in hexafluoro-iso-Pr alc. of 0.97 dL/g.

- AB A process for producing a braided **suture** having an
improved knot strength comprise heating a braided **suture**
coated with a low mol. wt. biocompatible polymer to a temp.
sufficient to melt the low mol. wt. biocompatible polymer for a time
sufficient to allow the low mol. polymer to be redistributed into
the interstices of the braided **suture** thereby providing a
coated braided **suture** with an improved knot tensile
strength. Also disclosed is the coated braided **suture**
having a low mol. wt. polymer optimally dispersed throughout the
braided **suture**'s cross-section. Poly(L-lactide-glycolide)
was prepd. from a mixt. of 95 mol % L-lactide and 5 mol % of
glycolide monomer in presence of stannous octoate. The polymer was
extrude, braided, and coated with poly(ϵ -caprolactone-
glycolide). The straight and knot tensile strength and elongation
of the **suture** thus obtained was 29.12, 15.90 lb and 32%,

L22 ANSWER 8-OF 20 HCAPLUS COPYRIGHT 2004 ACS on STN

1999:21716 Document No. 130:86209 Absorbable, biocompatible aliphatic
 polyesters of trimethylene carbonate, epsilon-caprolactone and
 glycolide and their medical use. Erneta, Modesto; Vhora, Idrish A.
 (Ethicon, Inc., USA). U.S. US:5854383 A 19981229, 9 pp.
 (English). CODEN: USXXAM. APPLICATION: US 1997-944792 19971006.

AB Absorbable, segmented copolymers comprising glycolide (I),
 trimethylene carbonate (II) and ϵ -caprolactone (III),
 exhibit a broad range of properties, esp. high strength, low
 modulus, and fast in vivo absorption, and have a variety of medical
 uses. The absorbable, segmented copolymers can be processed into
 filaments, films, foams and molded articles for surgical and medical
 applications such as burn dressings, fascial substitutes, liver
 hemostasis devices, bandages, arterial grafts or substitutes,
sutures, etc. Thus, a segmented copolymer made by
 three-stage polymn. of the compn., III:II:I 26:10:12, I 12, and I 40
 mol% with heat and stannous octoate catalyst, was extruded and drawn
 into size 4-0 **sutures** with orientation. The
sutures give 45.0% elongation, 84.7 kpsi modulus, 3.939 lbs
 straight tensile (0 day), 2.18 lbs (12 days), and 4.53 lbs (0 day)
 after annealing at 90° for 6 h at 5% relaxation.

L22 ANSWER 9 OF 20 HCAPLUS COPYRIGHT 2004 ACS on STN

1998:580003 Document No. 129:221216 Bioresorbable waxlike composition, its use as bone wax, and method for its preparation. Oberhoffner, Sven; Planck, Heinrich (Deutsche Institute fuer Textil- und Faserforschung Stuttgart - Stiftung des Oeffentlichen Rechts, Germany). Ger. Offen. DE 19706621 A1 19980827, 6 pp. (German). CODEN: GWXXBX. APPLICATION: DE 1997-19706621 19970220.

AB A waxy compn. for use in filling bone defects and as a hemostatic during bone surgery comprises a bioresorbable, completely amorphous statistical terpolymer of trimethylene carbonate, ϵ -caprolactone, and glycolide or glycolic acid. This compn., in the preferred mol. wt. range of 5000-50,000, has a glass transition temp. of -30 to 0°, an inherent viscosity of 0.1-0.9 dL/g, and shows good plasticity. The mol. wt. of the compn. can be regulated by addn. of ≥ 1 mono- or polyvalent alc. or of a mono- or divalent carboxylic acid or anhydride or ester thereof. It may addnl. be formulated with a plasticizer, a bone growth promoter, and/or an adhesive agent. Thus, 1,3-dioxan-2-one 350, caprolactone 350, glycolide 300, and a soln. of Sn octanoate 0.2 g in Et2O were placed in a reactor, the Et2O was removed under vacuum at 50°, and the mixt. was stirred under Ar at 1.5 bar and 205° for 5 h to produce a transparent, plastic polymer with an inherent viscosity of 0.798 dL/g and a glass transition temp. of -25.6° which was readily shaped.

1997:479288 Document No. 127:99861 Hydrophobic resorbable polyesters for medical use. Rafler, Gerald; Jobmann, Monika; Mueller, Bernd (Fraunhofer-Gesellschaft Zur Foerderung Der Angewandten Forschung E.V., Germany). Eur. Pat. Appl. EP 778304 A2 19970611, 8 pp. DESIGNATED STATES: R: CH, DE, FI, FR, GB, LI. (German). CODEN: EPXXDW. APPLICATION: EP 1996-117263 19961028. PRIORITY: DE 1995-19545327 19951205.

AB Polyesters such as polylactides, lactide/glycolide copolymers, and poly(trimethylene carbonate) are rendered hydrophobic by reaction of terminal OH and/or CO₂H groups with long-chain fatty acids and/or fatty alcs. or their derivs. The hydrophobic polyesters are useful as matrix or coating materials for parenteral controlled-release dosage forms, as materials for temporary implants, and as coatings for implants. Thus, L,L-dilactide was subjected to ring-opening polymn. in the presence of stearyl alc. and Sn(II) octanoate as initiator at 170°. The product, contg. 1.9% stearyl groups, had an interfacial tension of 26.1 mN/m in the system CH₂Cl₂/H₂O.

1995:294636 Document No. 122:170272 Castor oil polymers for
fabricating and coating medical and surgical devices. Bezwada, Rao
S.; Hunter, Alastair W.; McGregor, Walter; Shchervinsky, Semyon
(Ethicon, Inc., USA). U.S. US 5371176 A 19941206, 7 pp.
Cont.-in-part of U.S. Ser. No. 13,858, abandoned. (English).
CODEN: USXXAM. APPLICATION: US 1993-142529 19931022. PRIORITY: US
1993-13858 19930205; US 1993-15706 19930209.

AB A polymer, particularly a biomedical polymer for the fabrication of
medical and surgical devices and for use as a coating, is described.

The polymer is derived from the reaction product of one or more lactone monomers and castor oil, preferably (a) ϵ -caprolactone, trimethylene carbonate, or an ether lactone; (b) castor oil; and (c) glycolide, lactide or 1,4-dioxanone. The preferred polymer is derived from ϵ -caprolactone, castor oil, and glycolide. The polymer in preferred embodiments is ideally suited for use as a coating for a surgical **suture**, particularly an absorbable, braided multifilament **suture** and **surgical needles**. For this application, glycerol is advantageously added to the reactive monomer mix from which the polymer is derived. Prepn. of the copolymers of the invention is described. Phys. and handling properties of **sutures** coated with copolymers of the invention are included. The results show that the castor oil copolymers improve the wet knot slide-down and reduce the tissue drag while maintaining comparable phys. properties relative to an uncoated control. Other results show significantly reduced penetration values for coated needles of the invention relative to the penetration value exhibited for an uncoated control.

 L22 ANSWER 18 OF 20 HCAPLUS COPYRIGHT 2004 ACS on STN
 1991:687274 Document No. 115:287274 Method for improving the storage stability of absorbable **sutures** and other medical polymeric articles susceptible to hydrolytic degradation. Hermes, Matthew E.; Muth, Ross R. (United States Surgical Corp., USA). U.S. US 5051272 A 19910924, 7 pp. (English). CODEN: USXXAM.
 APPLICATION: US 1988-221308 19880719.

- AB The storage stability of polymeric articles (e.g. absorbable **sutures**, prostheses, gauze, etc.) susceptible to hydrolytic degrdn. is improved by application of a storage-stabilizing amt. of a mixt. comprising ≥ 1 water-sol. hygroscopic polyhydroxy compd. and/or ester thereof and ≥ 1 $\text{RCH(OH)(CH}_2\text{)}_n\text{CO}_2\text{R}_1$ ($\text{R} = \text{H, Me}$; $\text{R}_1 = \text{alkali metal or alk. earth metal}$; $n = 0, 1$) or a hydrate thereof to the article, the agent being retained by the article prior to sealing of the enclosure in which the article is packaged. Thus, samples of braided **sutures** filled with glycerin-calcium lactate showed equally improved stability to storage compared to glycerin-filled braid without Ca lactate. Addn. of Ca lactate to glycerol gave an increase in glycerol retention in braided **sutures**.

L22 ANSWER 19 OF 20 HCAPLUS COPYRIGHT 2004 ACS on STN
1989:237192 Document No. 110:237192 Caprolactone block copolymers as
coatings for surgical articles. Jarrett, Peter K.; Casey, Donald
J.; Lehmann, Leonard T. (American Cyanamid Co., USA). U.S. US
4788979 A 19881206, 7 pp. Cont.-in-part of U.S. Ser. No. 910,598,
abandoned. (English). CODEN: USXXAM. APPLICATION: US 1988-172608
19880324. PRIORITY: US 1986-910598 19860923.

AB A bioabsorbable coating for a surgical article comprises a copolymer
manufd. from the monomer caprolactone and ≥ 1 other
copolymerizable monomers. A mixt. contg. 80 g ϵ -
caprolactone, 1.585 mL lauryl alc. , and 39.5 μ L stannous octoate
was stirred at 180-200° over 8 min and 60 g glycolide and 60
g ϵ -caprolactone were added to give ϵ -caprolactone-
(ϵ -caprolactone-glycolide) AB block copolymer (I). Coatings
(2.57% of the coated **suture**) were applied to 1/0
polyglycolic acid braid from a 3.5% (wt./vol.) soln. of I dissolved
in Me₂CO. The coated **suture** was passed through 2 sides of
a wound in dogs and satisfactory knot repositioning ability and knot
security were obsd.

1988:556306 Document No. 109:156306 Bioabsorbable coating for
sutures and ligatures. Jarrett, Peter Kendrick; Casey,
Donald James; Lehmann, Leonard Theodore (American Cyanamid Co.,
USA). Eur. Pat. Appl. EP 261470 A1 19880330, 16 pp. DESIGNATED
STATES: R: BE, CH, DE, ES, FR, GB, GR, IT, LI, NL, SE. (English).
CODEN: EPXXDW. APPLICATION: EP 1987-112860 19870903. PRIORITY: US
1986-910598 19860923.

AB The title coatings consist of polymers based on the monomer
caprolactone, contg. [O(CH₂)₅C(O)] (I). An ϵ -caprolactam-1-
lactide copolymer (II) was prepd. (details given); it had inherent
viscosity 0.50 dL/g (0.5 g/dL in CHCl₃). A coating of II was
applied to a 1/0 poly(glycolic acid) braid using a 2% acetone soln.
for 1.6% coating pickup by the **suture**. In in-vitro tests,
the coated **suture** showed knot repositioning (slippage
within the knot up the breaking point) 25.1 mm, knot security
(defined) 11.9 mm, and good wet and dry knot run-down, vs. 2.8 and
1.6 mm, with run-down not measured, for an uncoated **suture**
. In in-vivo tests, a **suture** with 1.8 wt.% coating pickup
showed satisfactory knot repositioning in 10 out of 18 tests, while
16 samples out of 18 showed good knot security, vs. 0/8 and 0.4 for
a control **suture**.

L23 ANSWER 1 OF 5 HCAPLUS COPYRIGHT 2004 ACS on STN
2003:133976 Document No. 138:175946 Polymer-based medical implant having bioabsorbable textured surface. McGhan, Jim J. (USA). U.S. Pat. Appl. Publ. US 2003036803 A1 20030220, 8 pp. (English). CODEN: USXXCO. APPLICATION: US 2001-931692 20010814.
AB A hybrid medical implant having a biocompatible, nonabsorbable core portion and a bioabsorbable textured outer surface portion overlying the core portion. The hybrid implant is useful as a prosthesis for tissue augmentation and/or reconstruction. The core portion of the implant includes a body formed from a nonabsorbable, biocompatible implantable material such as silicone or urethane elastomer. The core portion may be either a solid body, a viscous gel body or a fluid-filled shell. The textured outer surface portion envelops the core portion and presents an irregular, bioabsorbable textured surface to the exterior environment. As a capsule forms around the implant following implantation, the irregular contour of the outer surface of the implant disorients structural proteins in the capsule to impede spherical contraction thereof. Either during the formation of the capsule and/or after the capsule is formed, the

outer bioabsorbable surface portion of the implant is absorbed by the body of the host. After bioabsorption of the bioabsorbable outer surface portion, the remaining core portion of the implant remains enveloped by the capsule but unattached to capsular tissue. The outer bioabsorbable portion of the hybrid implant may include more than one biocompatible, bioabsorbable material.

AB Porous, bioabsorbable scaffolds for tissue engineering of human hair
follicles, methods for their manuf. and methods of their use in
creating new hair are disclosed. PEG was melt extruded into a
1.0-mm diam. filament and cut into 2-cm lengths. was melt extruded
into a 1.0 mm 10 diam. filament and cut into 2 cm lengths. One of
the PEO filaments was dipped into water, hydrating the surface and
making it sticky. This was then dipped into sodium chloride
crystals that had been ground into fine particles. Excess salt was
shaken off and the coating was allowed to dry. A 10% soln. of
Resomer RG 504 (PLGA) was dripped onto the salt encrusted PEG
filament and the excess soln. was allowed to run off. Addnl. powd.
salt was sprinkled onto the surface until it was completely covered.
After the acetone evapd., the coated PEG filament was placed in
water until all of the salt and PEG dissolved, leaving a hollow
filament of porous PLGA which was removed, flattened, and cut into
thin strips. The strips were rolled between finger and thumb and
cut into 2-mm lengths. A 0.3-mm diam. concentric hole was made in
the end of another PEG filament by pressing a heated needle about
2-mm into the PEG. This caused molten PEG to build up around the
sides of the filament. The hole was then filled with one of the
above rolled strips of porous PLGA. Upon evapn. of the acetone and
dissolving all of the salt and PEO in water and drying, the desired
porous bioabsorbable polymer scaffold was obtained.

EP 499205 A2 19920819, 8 pp. DESIGNATED STATES: R: DE, ES, FR, GB, IT. (English). CODEN: EPXXDW. APPLICATION: EP 1992-102262 19920211. PRIORITY: US 1991-654219 19910212.

AB Bioabsorbable polymer particles are prep'd. by rotary atomization. The polymer particles can be used in the repair of bone or tissue. A glycolide-l-lactide copolymer was heated, applied from an extruder of a screw type to a rotary atomizer having a spinning disk, with the disk being heated, and the polymer was applied as a thin film on the spinning disk. The polymer film was broken into particles and collected and cooled.
